FOREWORD	v
INTRODUCTION	vii
CHAPTER 1. ATMOSPHERIC PROCESSES ENABLING SOARING FLIGHT	1-1
1.1 Overview.....	1-1
1.2 Convective lift	1-2
1.2.1 Introduction	1-2
1.2.2 Thermal size and strength.....	1-2
1.2.3 Distribution and life cycle of thermals	1-3
1.2.4 Diurnal variation of thermals.....	1-3
1.2.5 Factors influencing thermals.....	1-5
1.2.6 Organized convection	1-9
1.2.7 A pilot's view: a flight in thermal lift	1-9
1.3 Ridge lift.....	1-10
1.3.1 Mechanism	1-10
1.3.2 Meteorological factors	1-11
1.4 Wave lift.....	1-12
1.4.1 Waves in the atmosphere: wind and stability.....	1-12
1.4.2 Idealized two-dimensional mountain-wave system.....	1-13
1.4.3 Variations from the idealized conceptual model	1-14
1.4.4 A pilot's view: a flight in wave lift.....	1-18
1.5 Combined lift and other lift sources	1-19
1.5.1 Convective waves	1-19
1.5.2 Other possibilities.....	1-19
1.5.3 A pilot's view: a flight in combined lift.....	1-19
1.6 Hazards	1-21
1.6.1 Thunderstorms	1-21
1.6.2 Strong winds and wind shear.....	1-22
CHAPTER 2. GLIDERS AND SOARING FLIGHT	2-1
2.1 Classes and performance	2-1
2.1.1 Straight-flight performance	2-2
2.1.2 Climb performance	2-2
2.2 Cruising speed	2-3
2.2.1 Localized lift	2-3
2.2.2 Extended lift.....	2-4
2.3 Ground speed.....	2-4
2.4 Effects on performance.....	2-4
2.5 Instrumentation and equipment.....	2-4
2.6 Procedures and operations.....	2-5
2.6.1 Ground handling.....	2-5
2.6.2 Take-off.....	2-5
2.6.3 Flight.....	2-6
2.6.4 Final glide and landing	2-6
2.7 Types of flight	2-6
2.7.1 Instructional and local flights	2-6

	<i>Page</i>
2.7.2 Cross-country flights	2-6
2.7.3 Competition flights	2-6
2.7.4 Record flights	2-7
CHAPTER 3. WEATHER FORECASTS	3-1
3.1 Observations and measurements	3-1
3.2 Numerical weather prediction	3-1
3.2.1 General	3-1
3.2.2 Data assimilation	3-2
3.2.3 Parameterization	3-2
3.2.4 Application models	3-5
3.2.5 Model products	3-6
3.3 Soaring forecasts	3-9
3.3.1 Convective lift	3-12
3.3.2 Horizontal convective rolls	3-16
3.3.3 Ridge lift	3-17
3.3.4 Wave lift	3-17
CHAPTER 4. METEOROLOGICAL SUPPORT FOR SOARING FLIGHT	4-1
4.1 Self-briefing	4-1
4.2 Personal briefing	4-1
4.2.1 Meteorological support for competitions	4-1
4.2.2 Preparation of soaring forecasts	4-1
4.2.3 Meteorological support for the task-setter	4-3
4.2.4 Documentation for pilots	4-4
4.2.5 Competition briefing	4-4
4.2.6 Monitoring the weather	4-5
4.2.7 Pilot support	4-5
4.3 Meteorological flight planning	4-5
CHAPTER 5. FLIGHT DATA	5-1
5.1 Flight documentation	5-1
5.1.1 Flight recorder	5-1
5.1.2 Flight data analysis	5-1
5.1.3 Flight data sources	5-1
5.2 Position of updraughts	5-1
5.2.1 Thermal lift	5-1
5.2.2 Ridge lift	5-2
5.2.3 Wave lift	5-2
5.3 Statistical analysis	5-2
5.3.1 Recorded climb rate	5-4
5.3.2 Recorded altitude	5-4
5.3.3 Convective boundary layer depth and climb rate	5-4
5.4 Verification of soaring forecasts	5-6
5.4.1 Thermal lift	5-6
5.4.2 Wave lift	5-7
CHAPTER 6. EPILOGUE	6-1
CHAPTER 7. REFERENCES	7-1
7.1 Articles	7-1
7.2 Bibliography	7-2
7.3 Websites	7-2
APPENDIX	A-1

FOREWORD

The key importance of soaring flight skills was recently highlighted in the media through the successful emergency "landing" over the Hudson River of an airliner which had fully lost its power. It is remarkable that the pilot involved in this emergency was also an experienced glider pilot, thereby underscoring the potential benefits of extending these skills to aviation as a whole.

The second edition of WMO Technical Note No. 158 *Handbook of Meteorological Forecasting for Soaring Flight* was released in 1993 as WMO-No. 495. From that time, significant changes have occurred in soaring flight forecasting, in particular since Numerical Weather Prediction has considerably progressed towards the spatial and temporal resolutions required to generate important physical variables needed for non-powered flight, such as climb rates and their temporal and spatial distributions.

Data volume from numerical weather prediction centres to pilots has increased significantly and improved predicted weather interfaces are now accessible to pilots. Available weather information and forecasts further support pre-flight decision-making and, reciprocally, flight recorders are contributing quantitatively to prediction improvement.

Accordingly, the International Scientific and Technical Soaring Organisation (OSTIV - Organisation Scientifique et Technique Internationale du Vol à Voile) meteorological panel, under the chairmanship of Mr Hermann Trimmel, took the initiative to produce this update in order to document progress achieved.

The following experts have contributed their knowledge, experience and time to this publication: René Heise (Germany), Wolf-Dietrich Herold

(Argentina), Rolf Hertenstein (United States), Edward Hindman (United States), Olivier Liechti (Switzerland), Erland Lorenzen (Germany), Christof Maul (Germany), Daniel Murer (Switzerland), Beda Sigrist (Switzerland) and Hermann Trimmel (Austria). To make the publication truly international, the following experts served as reviewers: Zafer Aslan (Turkey), Tom Bradbury (United Kingdom), Dan Gudgel (United States), Joerg Hacker (Australia) and Bernt Olofsson (Sweden).

Mr Olivier Liechti has served as working group chairman and Mr Edward Hindman as editor. The European Cooperation in Science and Technology (COST) generously provided support to working group sessions and the NMSs of Germany and Switzerland kindly hosted the meetings. The final document has been reviewed by the WMO Commission for Aeronautical Meteorology (CAeM).

The aim of this Technical Note is to provide the reader an internationally agreed set of guidelines for meteorological forecasting in soaring flight and related activities. As pointed out in the Introduction, this includes forecasters at busy aerodrome meteorological offices routinely receiving enquiries from pilots, as well as those detached on the field to provide forecasting support during contests and shows.

WMO is therefore pleased to make this highly relevant publication available to the wider soaring flight community.

(M. Jarraud)
Secretary-General
